

Module: 14- Identity with Windows Server

31. Explain the process of installing and configuring Hyper-V virtualization in Windows Server 2016.

- First, open Server Manager → click “Add Roles and Features” → select Hyper-V → install it and restart the server.
- After installation, open Hyper-V Manager → create a Virtual Switch (for internet/network) then create a new Virtual Machine, assign RAM, storage, and install an OS.

32. How do you monitor server performance and manage event logs in Windows Server?

To check server performance, use:

- Task Manager → see CPU, RAM usage
- Performance Monitor → detailed graphs
- Event Viewer → shows system errors, warnings, and logs

This helps find problems like high CPU or system errors.

33. Describe the different types of storage options available in Windows Server.

Windows Server supports:

- DAS → storage directly connected to server
- NAS → storage over network
- SAN → high-speed storage network
- Storage Spaces → combine multiple disks into one

These options help store and manage data efficiently.

34. What is the role of File Server in Windows Server, and how do you configure it?

Role of File Server

- A File Server stores and shares files across network users.
- To configure:
- Server Manager → File and Storage Services → create a shared folder → set permissions (who can access).

- It is used in offices to share documents.

35. Explain the process of implementing and managing Distributed File System (DFS) in Windows Server 2016.

- DFS allows you to access files from multiple servers using one path.

Steps:

- Install DFS → create Namespace (main folder path) → add shared folders → enable replication (copies data to multiple servers).
- This improves availability and load sharing.

36. Discuss the built-in backup and recovery options available in Windows Server 2016 or 2019.

Windows Server provides:

- Windows Server Backup → full system backup
- System Restore → restore system settings
- File History → restore files
- Bare Metal Recovery → restore complete server
- These help protect data from loss.

37. How do you configure Windows Server Backup to back up critical data?

- Install Windows Server Backup feature → open it → click “Backup Schedule” → choose files/folders → select backup location (disk/network) → set time → finish.
- Backups will run automatically.

38. Explain the steps for restoring files and folders using Windows Server Backup.

Open Windows Server Backup → click “Recover” → choose backup date → select files/folders → choose restore location → start recovery.

Files will be restored safely.

39. What are some common troubleshooting techniques for Windows Server startup issues?

If server doesn't start:

- Use Safe Mode
- Use Startup Repair
- Check Event Viewer logs
- Use Command Prompt to repair boot (bootrec commands)
- This helps fix boot problems.

40. How do you troubleshoot network connectivity problems in Windows Server?

Network Troubleshooting

Steps:

- Check IP using ipconfig
- Test connection using ping
- Check DNS settings
- Check cables and switches
- Disable firewall temporarily (for testing)
- This helps identify network issues.

41. Discuss common Active Directory-related issues and their troubleshooting steps.

Common problems:

- Login failure
- DNS issues
- Replication errors

Fix by:

- Checking DNS
- Restarting services
- Using tools like "dcdiag"

Active Directory is very important for user management.

42. Explain how to troubleshoot performance problems on Windows Server 2016 or 2019.

Troubleshooting Performance Problems

If server is slow:

- Check Task Manager (CPU, RAM)
- Use Performance Monitor
- Check disk usage
- Stop unnecessary programs
- Update system

This improves server speed and stability.
